Beijing, China

Professional Summary

Results-driven Computer Science undergraduate at Beijing Institute of Technology with hands-on experience in Python, SQL, network analysis, Linux environments, and full-stack project development. Proven ability to design and deliver software systems, data visualisations, and automated agents from scratch. Multilingual professional (English, Arabic, French, Mandarin) with strong cross-cultural communication skills—well-suited for overseas deployment and client-facing solution delivery. Highly motivated to apply technical expertise and solution-oriented thinking in supporting IT infrastructure operations and client-facing solution delivery.

Education

Beijing Institute of Technology (BIT)

Bachelor of Engineering – Computer Science & Technology

Beijing, China

Sept 2023 – Present

- Core coursework: Computer Architecture, Operating Systems, Computer Networks (Wireshark Labs), Data Structures & Algorithms, Database Systems, Software Engineering
- Active engagement in practical lab work including Unity3D VR development, network protocol analysis, and system-level programming

Technical Skills

Languages: Python, SQL (MySQL/SQLite), C#, JavaScript, $\text{\LaTeX}$, Bash/Shell scripting

Frameworks & Libraries: D3.js, Unity3D, Node.js (basic), Three.js (basic)

Systems & Tools: Linux (Ubuntu/Debian), Git, VS Code, Wireshark, Nmap, network packet analysis

Cloud & DevOps Concepts: Docker (basic), Kubernetes / K8S (conceptual), NFV basics, REST APIs

Data & Analysis: SQL queries & optimisation, data pipeline scripting, log parsing, CSV/JSON processing

Other: VR application development (Unity3D), report automation, LLM-assisted analysis tools

Project Experience

AI-Assisted Network Security Monitoring Agent

2026

Personal Project – Python, Rule Engine, LLM Integration

- Designed and built a modular security agent (`agent.py`) capable of real-time log monitoring, anomaly detection, and automated reporting
- Implemented a rule-based engine (`rule_engine.py`) with configurable threat signatures
- Integrated an LLM-based log analyser (`llm_analyzer.py`) for contextual threat assessment
- Generated structured $\text{\LaTeX}$ and PDF reports automatically from system log data, demonstrating end-to-end pipeline automation
- Aligns with IT Engineer roles: system monitoring, fault detection, scripting, and maintenance record management

Interactive CO₂ Emissions Data Visualisation

2025

Personal Project – D3.js, JavaScript, HTML/CSS, GitHub Pages

- Built a fully interactive, browser-based data visualisation dashboard displaying global CO₂ emissions trends using D3.js
- Engineered Python data pipeline (`gen_data.py`) to process raw datasets into structured JSON for front-end consumption

- Deployed publicly via GitHub Pages; applied responsive CSS design and dynamic user interaction (tooltips, filters, transitions)
- Demonstrated full-stack thinking: from data ingestion to visual storytelling and deployment

Computer Networks Protocol Analysis (Wireshark Labs)

2025

Academic Project – Wireshark, TCP/IP, HTTP, DNS, ARP

- Conducted deep packet inspection across multiple network protocols (HTTP, DNS, TCP, ARP, ICMP) to analyse and document network behaviour
- Documented findings in professional academic reports; identified performance bottlenecks and fault patterns at the protocol level
- Aligns with IT Engineer roles: foundational knowledge of IT system architecture and network fault troubleshooting

VR Environment Simulation – Unity3D

2025

Academic Project – Unity3D, C#, Physics Simulation

- Developed two complete Unity3D projects: a physics-based bouncing ball simulation and a 3D environment simulation with interactive elements
- Applied Rigidbody physics, material configuration, and scene lighting; scripted game logic in C#
- Demonstrated ability to learn and deliver results in a new technology stack rapidly — reflecting strong learning ability

System Architecture & Hardware Analysis Reports

2024–2025

Academic – Computer Organisation & Architecture

- Authored comprehensive technical documents covering CPU design, cache hierarchy, instruction pipelining, memory systems, and I/O architectures
- Translated complex hardware concepts into structured written analyses, mirroring the documentation and solution-presentation skills required for Solution Manager roles

Core Competencies

- | | |
|--|---|
| • IT System Monitoring & Fault Troubleshooting | • Solution Documentation & Presentation |
| • Python Scripting & SQL Data Management | • Client-Needs Analysis & Framework Design |
| • Network Protocol Analysis (TCP/IP Stack) | • Fast Learner – Multiple Tech Stacks Delivered |
| • Cross-Functional Technical Communication | • Strong Logical Thinking & Problem Solving |

Languages

English	Arabic	French	Mandarin Chinese
Fluent / Native	Conversational	Conversational	Intermediate (studying)

Research & Innovation Project

National College Student Innovation & Entrepreneurship Training Program

BIT, 2023–2024

LoRa Wireless Sensor-based Lab Safety Early Warning & Monitoring System

Project No. BIT2023XX164

- Participated in a school-level innovation project developing a real-time laboratory safety monitoring system using LoRa wireless sensor networks
- System designed to detect environmental hazards (gas leaks, temperature anomalies) and trigger early-warning alerts for lab safety management
- Collaborated in a cross-disciplinary team of 5 under faculty supervision; project successfully completed and certified (Rating: Pass) in November 2024
- Aligns with IT Engineer roles: IoT sensor integration, system monitoring design, fault detection logic, and team-based technical delivery

Additional Information

- **Availability:** Open to overseas deployment — Northern & Southern Africa Region

- **Work Authorization:** International student at BIT; eligible for global graduate programmes
- **Interests:** Distributed systems, cloud-native technologies, AI-assisted tooling, network infrastructure
